This sequence encodes a protease of the invention have extremely high thermal stability. The proteases of the invention have extremely high thermal industriality. The proteases can be used as research reagents, and industrially in the food, drug and chemical industries. The invention relates to a hyperthermostable protease derived from a thermophilic becterium (especially Pyrococcus furiosus). The protease has working temperature 40-110 deg-C (optimum 80-95 deg-C), working pH-5-10 et 95 deg-C), and retains more than 90% of its activity after, 3 hours polypeptide of formula SiG-Ala-Cly-Cly-Asn-PRO, where SiG is a signal polypeptide of formula SiG-Ala-Cly-Cly-Asn-PRO, where SiG is a signal peptide from subtilisin, and PRO is the above protease whost cells genes are used for the recombinant production of the protease. The hyperthermostable protease which can be prepared in quantity suitable. For industrial use, can be used as an additive for drugs, washing agence and foodstuffs and for chemical synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

This sequence represents a fragment of the coding sequence for the processe from Thermococcus celer DSN-2476 (see AAT85667 for full length sequence). This sequence excodes a fragment of the processe of the invention. The processes of the stability. The processes can be used as research reagents, and industrially in the fooc. Erry and chemical industries.

Pyrococcus furtosus hypersteermostable protease gene - useful for recombinant prodn. of hypersthermostable protease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to the hyperthermostable protease of Pyrococcus furiosus and its prodn. as a recombinant protein in transformants using a vector carrying the protease gene (AATD8141). A genomic DPA sequence of the invention is given in AAT08131 and its encoded grotein in AAR87009.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ະ

This sequence represents a fragment of the coding sequence for the protease from Thermococcus celer DSM-2476 (see AAT85667 for full length sequence). This sequence encodes a fragment of the protease of the invention. The proteases of the invention have extremely high thermal stability. The proteases can be used as research rengents, and industrially in the food, drug and chemical industries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         947 AAGSCCAGGGACCTTCTGCTGA~CGCGGGATGATAGACAGGGTTACTTCGGTAACACA 1006

This sequence encodes a protease of the invention have extremely high thirmal stability. The proteases can be used as research reagents, and industrially in the food, drug and chemical industries.
                                                                                                                                                                                                     GGAACCCACGTIGCGGGTATCGTTGCCGGAACCGGCAGGGTTAACTCCCAGTACATAGGC 660
                                                                                Protease(s) and genes encoding them obtained from Thermococcus, Pyrococcus strains - have extremely high thermal stability and useful industrially and as research reagents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1962 BP; 602 A; 399 C; 471 G; 490 T; 0 other;

The invention relates to a hyperthermostable protesse derived from a thermophilic bacterium (especially Pyrococcus furiosus). The protesse has working temperature 40-110 deg-C (optimum 80-95 deg-C), working pH 5-10 at 95 deg-C. The invention and then 90 of its activity after 8 hours polypoptide of formulas SG-Ala-Cly-Cly-And-PRO, where SIG is a signal pettide from subtiliasin, and PRO is the above protesse Host cells pettide from subtiliasin, and PRO is the above protesse Host cells genes are used for the recambing trouble of the protesse. The hyperthermostable protesse which can be prepared in quantity suitable for industrial use, can ha used as an additive for drugs, washing agents and foodstuffs and for chamical synthesis.
                                                                                                                                                                                                                                                                  Recombinant hyperthermostable protease from Pyrococcus furiosus -
and gene encoding it, for large scale production of the protease for

```

```
This sequence represents the coding sequence for the protease from pyrococcus furiosus DSM-1618. This sequence encodes a protease of the invention. The proteases into the invention have extremely high thermal stability. The proteases can be used as research reagents, and industrially in the food on the communical industries.
                                                    83

                 the invention relates to a hyperthermostable protease derived from a thermophilic bacterium (especially Pyrococcus furiosus). The protease has working temperature 40-110 deg-C (optimum 80-95 deg-C), working PH-5-10 (optimum 6-9), and retains more than 90% of its activity after 8 hours at 95 deg.C. The invention also provides gene sequences encoding a polypeptide of formula SIG-Ala-CHY-GHY-ABA-FRO, where SIG is a signal peptide from subtilisin, and PRO is the above protease. Host cells genes are used for the recombinant production of the protease. The hyperthermostable protease which can be prepared in quantity suitable for industrial use, can be used as an additive for drugs, washing agents and foodstuffs and for chemical synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1055 CATCATAGCCCCGCGCCCAGCGAACCAGCATGGGCACCCCGATAAACGACTACTACAC MAAAA

This sequence represents a fragment of the coding sequence for the protease from Thermococcus celer DSM-2176 (see AAT85667 for full length sequence). This sequency encodes a fragment of the protease of the invention. The proteases the invention have extremely high thermal stability. The proteases can be used as research reagents, and industrially in the food, drug and chemical industries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                018 GGAAGGCTCAAGCCGGAAGTCGTCGCCCCCGGCGTTGACATCATAGCCCCGGGCGCGAGC 1077

The ensyme allows the efficient conversion of 4-substituted-1,4-dhydropyridine esters to chiral partially hydrolysed derivatives, for use in the synthasis of cardiovascular drugs suitable for the treatment of e.g. hypertension and ischaemic heart disease.

The Invention relates to a hyperthermostable protease derived from a thermophilic bacterium (especially Pyrococcus furiosus). The protease has working temperature 40.110 deg-C. Optimum 80.95 deg-C), working phi.5-10 at 95 deg-C), working phi.5-10 at 95 deg-C. The invention also provides gene sequences encoding a polypeptide of formula SIG-Ala-Gly-Gly-Asn-PRO, where SIG is a signal peptide from subtiliisin, and PRO is the above protease. Host cellasse (especially Bacillus strains) transformed with vectors comprising the genes are used for the recombinant production of the protease. The hyperthermostable protease which can be prepared in quantity suitable for industrial use, can be used as an additive for drugs, washing @gents and foodstuffs and for chemical synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ï

This sequence represents the protesse from Thermococcus celer DSN-2476. This sequence is a protesse of the invention. The protesses of the unvention have extremely high thermal stability. The protesses can be used as research reagents, and industrially in the food, drug and chemical industries.

The invention relates to a hyperthermostable protease derived from a thermophilic bacterium (especially Pyrococcus furiosus). The protease has working temperature 40-116-deg-C (optimum 80-95 deg-C), working pH 5-10 (optimum 619, and retains more than 90% of its activity after 8 hours at 95 deg-C. The invention also provides gene sequences encoding a polypeptide of formula SIG-Ala-Gly-Gly-Asn-FRO, where SIG is a signal peptide from subtilisin, and PRO is the above protease. Host cells especially Bacillus strains it transformed with vectors comprising the genes are used for the recombinant production of the protease. The hyperthermostable protease, which can be prepared in quantity suitable for industrial use, can be used as an additive for drugs, washing agents and foostuffs and for chemical synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     for
                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant hyperthermostable protease from Pyrococcus furiosus and gene encoding it, for large scale production of the protease industrial use.

The invention relates rota hyperthermostable protesse derived from a thermophilic bacterium (especially Pyrococcus furiosus). The protesse has working temperature 40-110 deg.C (optimum 80-95 deg.C), working pH 5-10
                                                                                                                                                                                                                                                                                                                                                                for

ä
 (optimum 6-8), and retains more than 90% of its activity after 8 hours at 95 deg C. The invention also provides gene sequences encoding a polypeptide of formula SiG-Ala-Gly-Gly-Asn-PRO, where SiG is a signal peptide from subtilisin, and PRO is the above protease. Host cells genes are used for the recombinant production of the protease. The hyperthermostable protease which can be prepared in quantity suitable for industrial use, can be used as an additive for drugs, washing agents and foodstuffs and for chemical synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     activity after 8 hours

The invention relates to a hyperthermostable protease derived from a thermoballic bacterium (especially Pyrococcus (turiosus). The protease has working temperature 40-110 deg.C (optimum 80-95 deg.C), working pH 5-10 (optimum 6-8), and retains more than 90% of its activity after 8 hours at 95 deg.C. The invention also provides gene sequences encoding a polypeptide of formula SIG-Na-Gly-Nan-PRO, where SIG is a signal peptide from subtilish, and PRO is the above protease. Host cells (especially Bacillus strains) transformed with vectors comprising the genea are used for the recombinant production of the protease. The flyperthermostable protease which can be prepared in quantity suitable for industrial use, can be used as an additive for drugs, washing agents and footstuffs and for charactal synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240

This sequence represents a fragment of the protease from Pyrococcus furiosus DSN-3638 (see AAW24122 for full length sequence). This sequence is a fragment of the protease of the invention. The proteases of the invention have extremely high thermal stability. The proteases can be used as research reagents, and industrially in the food, drug and chemical industries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 IDTGIDASHPDLQGKVIGWVDEVNGRSYPYDDHGHCTHVASIAACTGAASNGKYKGWAPG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The Invention relates to the hyperthermostable protease of Pyrococcus furiosus and its prodn. as a recombinant protein in transformants using a vector carrying the protease gene (AATO8141). A genomic DNA sequence of the invention is given in AATO8131 and its encoded protein in AAR87009.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   235 ADGSGSISTIIKGVEWAVDNKDKYGIKVINLSLGSSQSSDGTDSLSQAVNNAWDAGIVVC 294

This sequence represents a fragment of the protease from Thermococcus celer DSM-2476 (see AAW24121 for full length sequence). This sequence is fragment of the protease of the invention. The proteases of the invention have extremely high thermal stability. The proteases can be used as research respense and industrially in the food, drug and chemical industries.

                                                                                                                                                                                                                                                                                           21;
                                      This sequence is an asymmetric hydrolase encoded by the Streptomyces viridosporus dhpA gene. The enzyme acts on 4-substituted-1,4-dihydropyridine derivatives. The enzyme allows the efficient conversion of 4-substituted-1,4-dihydropyridine esters to chiral partially of 4-substituted-1,4-dihydropyridine esters to chiral partially substitutes, for use in the synthesis of cardiovascular drugs suitable for the treatment of e.g. hypertension and ischaemic heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      asymmetric hydrolase; dhpA; 4-substituted-1,4-dlhydropyridine; Picked derivative; Streptomyces viridosporus; ester; chiral; synthesis; (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985) (1985)

This sequence is a fusion protein comprising Streptomyces viridosporus dhpA gene product (an asymmetric hydrolase) winch acts on 4 substituted-1.4 dibydropyriddine daryvatives, and molanin from S. antibioticus. The DhpA enzyma allows the efficient conversion of 4 substituted-1.4 dibydropyriddine esters to chiral partially hydrolysed darivatives, for use in the synthesis of cardiovascular drugs suitable for the treatment of e.g. hypertension and ischaemic heart diseaso.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       347

This sequence is a fragment of an asymmetric hydrolase which acts one 4-substituted-1,4-dihydropyridine derivatives. The DNA sequence encoding the hydrolase (DhpA) was isolated from the chromosomal DNA of Streptomyces viidosporus. The enzyme allows the efficient conversion of 4-substituted-1,4-dihydropyridine esters to chiral partially hydrolysed derivatives, for use in the synthesis of cardiovascular drugs
